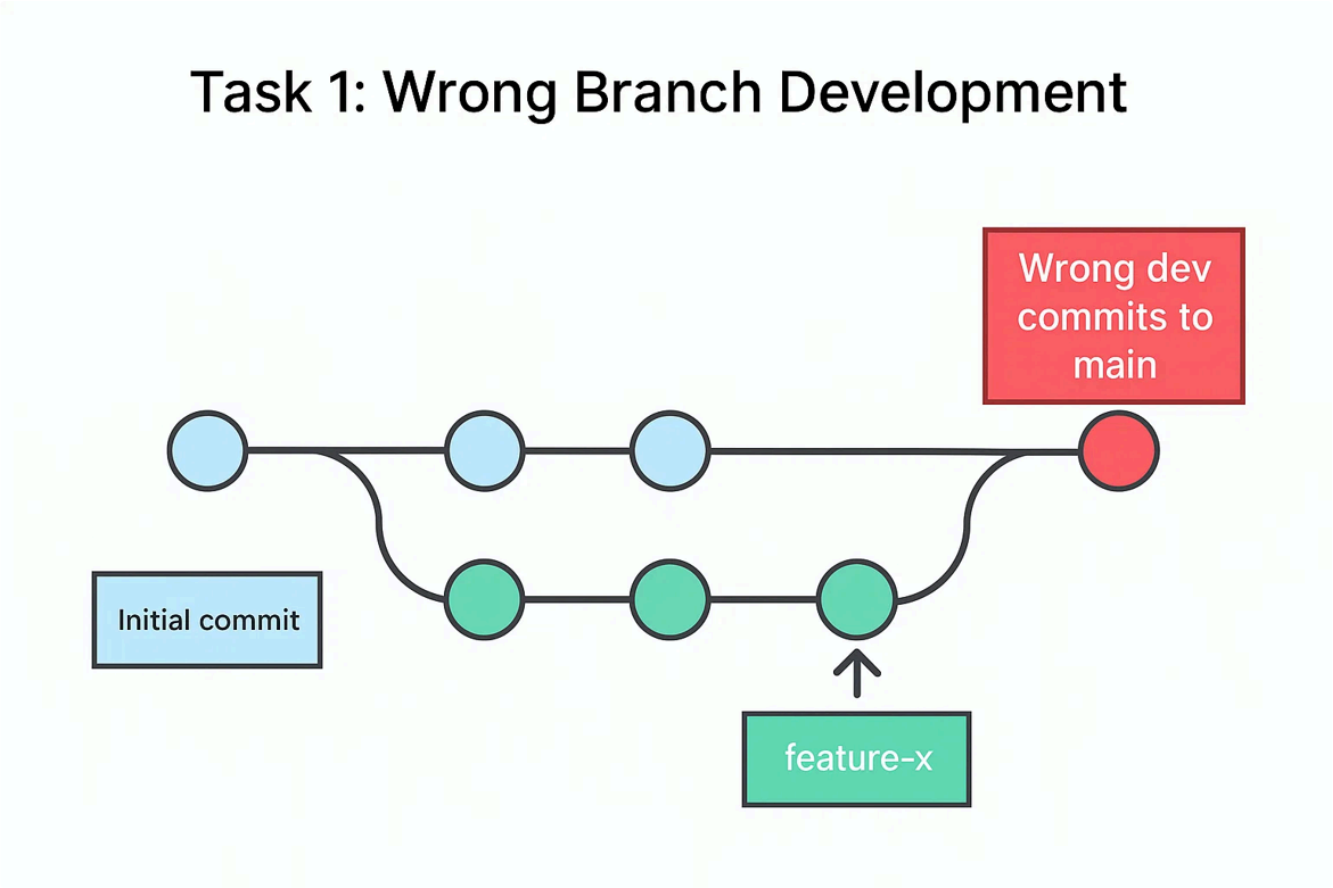
Task 24 : Wrong Branch Development (Merge Mistake)

Scenario

A feature was accidentally **merged into the `main` branch** instead of staying on its own branch. Now **main** contains both the stable code and the feature branch code.

The repository **demo-product** already exists in your GitLab CE server, and its `main` branch includes:

- An initial clean commit.
- A merge commit that pulled in the feature branch.
- All the feature commits are now part of `main`.



Task

Your job is to:

1. **Recreate the feature branch** (e.g. `feature-x`) containing all the feature commits.
2. **Restore** `main` to its original clean state (before the merge).

Intentional Bug

- The `main` branch includes an unwanted **merge commit** that brought in feature work.

Steps to Reproduce the Issue

1. **Log into GitLab**:
2. **Clone the repository**:
3. **Inspect the commit history**:

   You will see a **merge commit** on `main` that brought in feature commits.

Expected Deliverables

- A branch `feature-x` in GitLab containing all the feature commits from the mistaken merge.
- A restored `main` branch with only the initial clean commit (merge commit removed).
- CLI logs or screenshots showing:
  - The merge commit in history before the fix.
  - The corrected history after the fix.
- A short written summary of the **problem** and the **resolution applied**.
